

Photo-Mirror-Demister

Der beschlagfreie Spiegel für die dentale Fotografie

Ihr Helfer bei der Aufklärung und Beratung Ihrer Patienten

- beschlagfreier Spiegel durch Belüftung der Spiegelfläche
- brillante, hoch qualitative Bildreproduktion
- deutlich verbesserte Unempfindlichkeit gegen Kratzer
- einfache Fokussierung Ihrer Digitalkamera auf die Spiegelfläche
- kinderleichtes und sicheres Handling (Fotoaufnahmen ohne Assistance möglich)
- Bildaufnahmen für Patienten maximal störungsfrei (optimale Einstellung der Luftstromstärke)
- Spiegelkassette bietet den nötigen Komfort bei der Sterilisation und während der gesamten Aufbewahrungzeit der Spiegel

The mist-free mirror for dental photography

Your assistant for enlightenment and advice for your patients

- mist-free mirror due to the ventilation of the mirror surface
- brilliant, high-quality image reproduction
- significantly improved resistance to scratches
- simple focus of your digital camera on the image
- easy and safe handling (photographs without assistance available)
- image acquisition for most patients trouble-free (optimal adjustment of air current)
- mirror cassette provides the necessary comfort for sterilization and during the entire storage period of the mirror

A picture is worth a thousand words!

It's not possible to imagine today's dentistry without digital photography. The importance of patient source images for optimal aesthetics in communication with the dental laboratory is known as an indispensable aid for a long time. Whether for the documentation for insurance, for forensic support, for the therapeutic analysis (CRG), to publish their own cases in literature or for the descriptive before and after photography for patients: A suitable equipment for high-quality photography is essential.

In our practice, we have even begun to establish an own small photo studio for our patients, since the documentation and understandable presentation of our patient treatment cases plays an ever more important role. Before and after portfolios with the medical report and photographs of the condition in the mouth in detail as well as portraits illustrate the value of an investment in the aesthetics of a beautiful smile. By using the pictures this value can be communicated easily among relatives and friends. In the era of internet communities (facebook, you tube, flickr, my space, etc.) the communication between people by using pictures is getting more and more important. "I know of somebody you need to get to know sometime..." The provision of images turns the enthusiastic patient into a self-acting ambassador, who feels upon successful treatment appointed to further report about it.

Top equipment essential for high quality

Although the purchase of a mirror set is superficially seen initially expensive, one should understand clearly that it is a purchase for many years and also

that the picture quality of the exposure is directly dependent on the quality of the dental mirror and not only on the quality of the exposure optics and the skill of the photographer!

The quality of the new intra-oral photo dental mirror set of Jakobi Dental Instruments has clearly improved and compared to known systems important advantages emerge. In addition to classical things that can't be dispensed with in any acquisition any longer, as the LED lighting and the patented fan, which prevents fogging of the mirror in the mouth, the new mirror set contains further improved details. Thus, the body of the device is extended for easier handling and provides even more security in the optimal positioning of the mirror. The suted apparatus body as handle that provides perfect handling contributes to this as well. The new quality of the mirror surface, which contains no more rhodium, demonstrates its greatly improved resistance to scratches in the hard reality of everyday life - and this during constant, high quality image reproduction. Unlike the previous version the new mirror inserts can be used on both sides - this speaks for the extended use of resistance and an even wider range of applications again. Basically, the mirror set is so easy in its handling that the exposures can be for the patient as trouble free as possible and that the course of the treatment is thereby not burdened. By using retractors the stake is also simplified and the quality of the photos optimized. Disposable vinyl covers ensure a hygienically immaculate handling. The extensive Photo-Mirror-Demister Kit PRO facilitates with its many mirror inserts the optimal emphasis on the shooting situation. The mirror cassette provides the necessary comfort for sterilization and for the entire storage time. Therapists and patients appear equally delighted with the results of quality-oriented photography.

The intra-oral dental photo mirror set of Jakobi is not just an opportunity for a perfect documentation but because of the easy handling it is also routinely used for the patient and laboratory communication. As an innovative marketing tool we want to equip our patients with such high-quality images, so they can even act better voluntarily as ambassadors for our practice.
